

One-Page Website Creation & Deployment using Replit

Ariño, Cedric D.

BS Computer Science - 2B

21st Century IT Skills

Initial Prompt

“Create a one-page personal portfolio website for a student developer named Cedric Ariño, and generate the full project code in plain HTML, CSS, and vanilla JavaScript so it runs immediately in Replit without any framework setup. I want a polished, modern, dark-themed visual direction that looks premium and intentional, not a generic template. The overall mood should be professional and high-tech, with a near-black zinc background, layered radial light glows, and cyan, purple, and indigo accent colors. The page must be fully responsive and work cleanly on desktop and mobile. Please output complete code for index.html, style.css, and script.js, with all sections already wired and styled.

The page should be a single scrolling layout with a centered content container around 1100px max width, substantial vertical spacing, rounded cards, soft borders, blur effects, and depth through shadows. Build a fixed top navigation/header that starts transparent and turns into a translucent blurred panel when the user scrolls. On the left side of the header, place a circular logo image with a gradient ring and the uppercase name text Cedric Ariño. On the right side, create a compact pill-shaped menu with three items: Home, About, Contact. Each menu item should include an icon and label, with smooth hover interactions and visible active state. Make clicking each item smoothly scroll to the matching section with a slight offset so content is not hidden behind the fixed header.

The hero area should feel bold and personal. Add a small “Portfolio” badge above the main content. Use a large circular profile image in the center with a glowing gradient halo behind it, then a strong headline saying “Hi, I’m Cedric” with Cedric highlighted in cyan. Under that, add a supporting paragraph: “I build mobile apps as business solutions to real-world problems, focusing on clarity, usability, and impact.” Keep typography clean and modern, using Inter or similar sans-serif, with strong heading weights and balanced line height.

Immediately below, add a short about statement inside a rounded bordered card with subtle glass effect. Use this text: “Driven by problem-solving and clean design, with a focus on building products that feel intuitive and deliver real value.” Then create a highlights area with a responsive two-column arrangement. In the left card, add title “Laundr Prototype,” a short description about a laundry delivery app concept, and a vertical app preview image. In the right column, stack two smaller cards: one titled “Mobile Focus” with text about Flutter cross-platform UX and a Flutter image, and one titled “Leadership” with text about being Vice President for Internal Affairs at ACCESS and an ACCESS image. Use hover-lift animation and soft glow-shadow on all highlight cards.

After highlights, add a centered tech stack chip row with rounded pill tags for React, Next.js, TypeScript, Python, Java, and C++. Chips should have subtle gradient tint and animated hover feedback. Then build a full About Me section with the section label “About Me,” headline “Building products that solve real problems.”, and a paragraph explaining the goal of turning real-world pain points into practical mobile solutions and eventually becoming a startup CEO. Under that paragraph, add a responsive 2x2 card grid with the following card titles and content: What I’m Learning (Flutter and scalable structure), Strengths (problem-solving, UI thinking, maintainable code), Current Goal (launch a startup solving a real market need), and Leadership (organizing teams and helping peers grow in tech).

Below that, add a social block with at least one prominent GitHub button linking to <https://github.com/cdarino>. Then create a Contact section in two columns on desktop and one column on mobile. The left card should show contact details with labels and values: Email: cedricarino12@gmail.com, Phone: +63 966 182 5317, Location: Davao City, Davao del Sur. The right side should have a short invitation sentence and a message input with a Send button. Implement front-end form validation in JavaScript with these exact error messages: "Message cannot be empty.", "Message must be at least 3 characters.", and "Message cannot exceed 200 characters." Disable or visually mute the button when input is empty. On successful submit, clear the field and show a temporary toast at the top-right saying "Message sent!" for about 2 seconds.

Finish with a visually rich footer that includes glow effects, a small logo/name area, a short brand description, and simple text links for Home, About, Contact, and GitHub. Footer links for Home, About, and Contact should smoothly scroll to their sections. Add final copyright text: "© 2026 Cedric Ariño. All rights reserved." Ensure all images use proper alt text and semantic HTML tags are used throughout. For asset paths, assume these files exist in the project: Logo.jpg, Cedric.jpg, laundr.jpg, flutter.png, access.jpg; if any image is missing, style a graceful placeholder container so the layout still looks complete. Keep spacing, animation, and visual hierarchy refined so the finished page looks close to a premium modern portfolio rather than a basic classroom sample."

Refinement Prompts

Refinement Prompt #1:

“make use of the following images. place them in their appropriate locations according to their respective file names. if there are issues with the dimensions, prioritize the dimensions of the images and adjust their placeholders accordingly”

Refinement Prompt #2:

“the laundr image isnt fully visible in the ui. either make adjustments to the external container of its placeholder so the entire image is visible, or make the placeholder smaller to fit the external container. do this without significantly affecting the overall container of the highlights section. the access image also only shows color upon hovering. change this so that its colored at all times, similar to the flutter image”

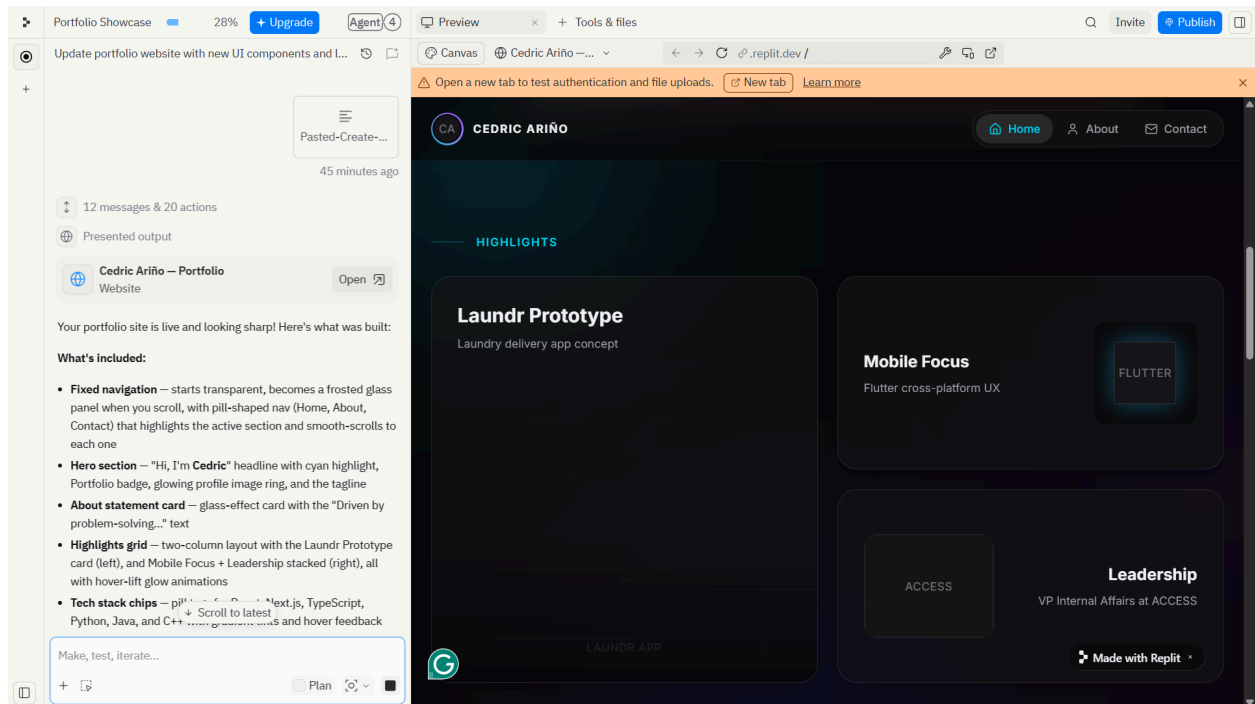

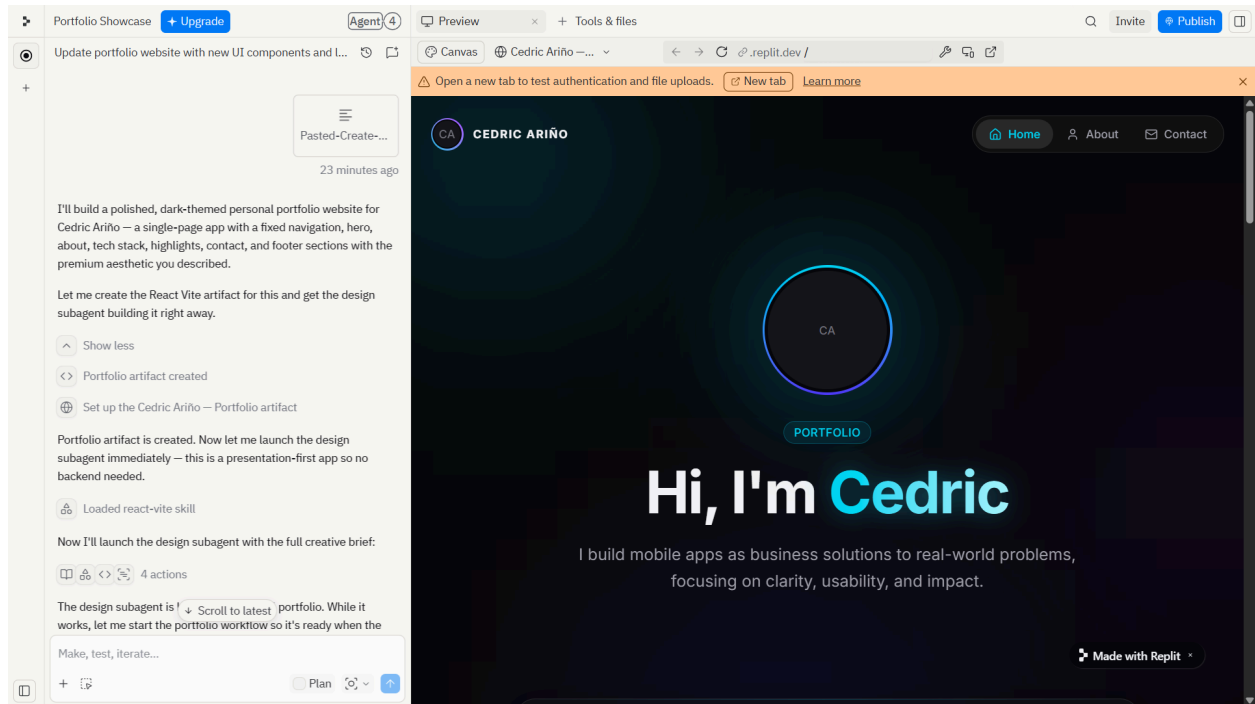

Refinement Prompt #3:

“the laundr image fits now, but upon hovering, it enlarges in such a way that it doesnt fully fit in its container, resulting in the top of the image appearing to get cut off. make it so that upon hovering, the entire image remains visible even after being enlarged”

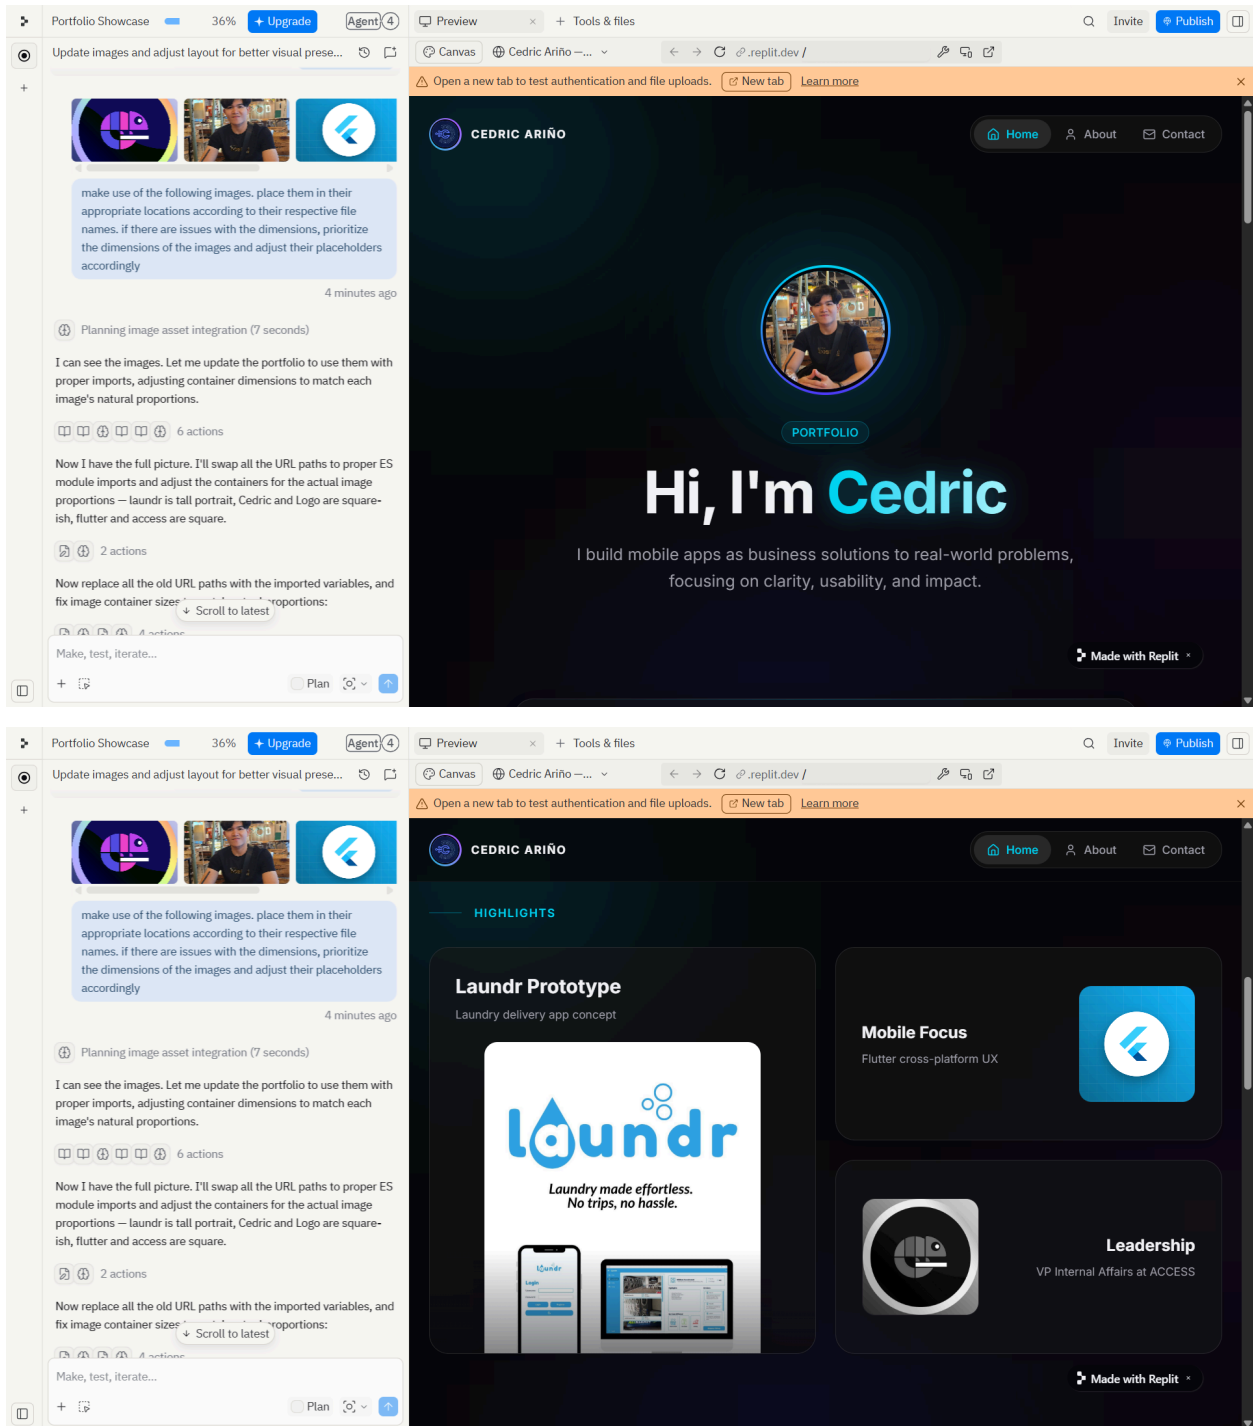

Refinement Prompt #4:

“retain the scale animation, however make it so that even with the animation, the entire image remains visible. also, add the same scale animation upon hovering to the profile image at the top”

Final Reflection

For this activity, what I found worked best was how effective a highly detailed initial prompt was. The AI followed the structure, design direction, and content closely, and it generated a one-page portfolio that already looked polished and modern. The visual effects, layout balance, and overall aesthetics came out strong from the start, so the first output felt solid enough to build on and no longer needed to be rebuilt.

What needed manual fixing was mostly image behavior and sizing. I had to run a refinement to make sure each image was placed correctly based on their file names, then a few more refinements to adjust placeholder and container dimensions so the images were fully visible. The Laundr image needed multiple passes because it was getting clipped, especially during hover scaling. During the fix, its scale animation got removed, so I had to manually re-add it while making sure the entire image stayed visible. I also had to fix the ACCESS logo so it stayed colored at all times instead of only on hover. For consistency, I also applied the same hover scale treatment to the profile image.

What I learned is that prompt quality really controls output quality. AI is much better now at following detailed instructions and generating production-looking results. Since I have already spent time experimenting with different AI tools and prompt engineering in the past, I usually know how to get the result I want, but I was still genuinely impressed by the level of prompt adherence and visual quality demonstrated by this AI. This activity reminded me that a strong first prompt can result in a great foundation, and that targeted refinement prompts can make the final result look truly polished.
