

Introduction

The proposed solution is a laundry delivery application designed to connect users with multiple laundromats through a single, easy-to-use digital platform. The system enables users to browse and select laundromats based on their preferences, supported by ratings and customer feedback to encourage informed decision-making.

Once a laundromat is selected, users can customize their laundry experience by specifying washing methods, preferred detergent and fabric conditioner brands, load separation options, and the number of loads. After entering pickup and delivery details, the system automatically generates a detailed bill reflecting both the base service cost and any additional charges for special instructions. By integrating service selection, customization, and logistics into one platform, the application aims to simplify and improve the overall laundry process.

Main Objectives

The primary objectives of the proposed laundry delivery application are as follows:

- To provide a convenient, end-to-end laundry solution that eliminates the need for users to physically visit laundromats.
- To save time and reduce effort for busy individuals by centralizing service selection, scheduling, and payment.
- To improve the quality and reliability of laundry services by allowing users to choose laundromats based on ratings, reviews, and transparent pricing.
- To increase user satisfaction through detailed customization options that ensure proper handling of laundry items.

Necessity and Problems Addressed

In today's fast-paced environment, many individuals, particularly students and working professionals, face time constraints that prevent them from regularly visiting laundromats. As a result, they often rely on nearby laundry services out of convenience rather than service quality. This leads to recurring issues such as clothes being returned unclean, missing or mixed-up items, and dissatisfaction with detergent quality.

Despite these concerns, customers frequently continue using the same laundromats due to limited time and a lack of accessible alternatives. The proposed application addresses these problems by offering a pickup and delivery service that removes the need for physical travel and by providing access to multiple laundromats within a single platform. The inclusion of user ratings, reviews, and service customization options allows users to make better-informed choices and achieve more reliable results.

Main Function

The main function of the proposed system is to streamline the laundry service process through the use of information technology. The application allows users to:

- Browse and compare laundromats based on ratings, reviews, and available services
- Customize laundry preferences, including washing methods, detergents, fabric conditioners, and load separation
- Schedule convenient pickup and delivery times
- Review order details before confirmation
- View an automatically generated bill that transparently lists service costs and any applicable additional charges

By centralizing these features into a single digital platform, the system reduces manual coordination, improves transparency, and enhances the overall user experience.

Proposed Impact

The proposed laundry delivery application demonstrates how technology can address everyday service inefficiencies. By reducing time spent on routine tasks and increasing transparency and accountability among service providers, the system aims to improve customer satisfaction and encourage higher service standards across participating laundromats.
